ABOUT THE DEPARTMENT OF BIOTECHNOLOGY

The department of Biotechnology was established in the year 2005. The Department of biotechnology has well qualified faculty with different subject specialization. Our department is equipped with sophisticated instruments and conducts UG as well as PG level courses. Alumni of the department are currently placed in Research Institute, Biotech Industries and Academics. The consistent efforts are being made continuously to improve the education standard. The department excels in teaching and providing laboratory training to both UO and PG students.

ABOUT THE CONFERENCE

Currently, agriculture is facing the challenge of meeting a growing demand for quality and safe food, including its nutritional value, ensuring food for the entire population. However, there is also the demand of producing in a context of price volatility, presence of several diseases and pests that reduce productivity, the limited shelf life of agricultural products, as well as the climate variability and natural disasters. These challenges have led agriculture to adopt different and diverse practices and technologies such as the use of fertilizers and pesticides.

The global regulatory scenario for pesticides of Chemical origin is increasing the number of restrictions on the use of this type of products, both in terms of their authorization, as well as the maximum residue limits allowed in food and feed. This triggers growing concern on public health, expressed by scientific bodies, consumers and several risk assessment and risk management agencies worldwide. This situation has encouraged the development of new products for plant protection and nutrition based on microorganisms such as bacteria, algae, protozoa, viruses and fungi, natural substances such as pheromones or semi-chemicals and invertebrates such as insects and nematodes, as well as botanical extracts. The use of this type of products, sometimes called Biopesticides or Biofertilizers, or Biostimulants depending on their functionality, is increasing in world agriculture as a complement or alternative to the use of traditional pesticides.

It is expected a significant increase in the global use of Biopesticides, Biofertilizers, and other farm inputs of natural origin in the production of food, feed and agricultural products, beyond their current use in organic production, which are traded internationally. The use of these products is being increasingly frequent, not only in organic agricultural production, but also in traditional agriculture, at the level of large producers, as well as medium and small producers. The present conference will focus on new methodology being adopted in research field and bring them to the level of agriculture field to sustain nutritional values and health benefits of the crops.
